Malus x ‘Snowdrift’
‘Snowdrift’ Crabapple

Edward F. Gilman and Dennis G. Watson

**INTRODUCTION**

‘Snow Drift’ Crabapple is a splendid tree and little pruning is required to develop a well-formed, rounded canopy (Fig. 1). Unfortunately, it is moderately or severely affected by fireblight disease. There appears to be little variation in shape among trees of this cultivar, a characteristic which is coveted by landscape architects. The bright white flowers in the spring give a refreshing look to the landscape and are followed by small, red-orange fruit eaten by birds. Fall color is good, providing a dull yellow glow for two or three weeks. Some Crabapples are alternate bearers, blooming heavily only every other year.

**GENERAL INFORMATION**

Scientific name: Malus x ‘Snowdrift’
Pronunciation: MAY-lus
Common name(s): ‘Snowdrift’ Crabapple
Family: Rosaceae
USDA hardiness zones: 4 through 8A (Fig. 2)
Origin: not native to North America
Uses: Bonsai; container or above-ground planter; espalier; large parking lot islands (> 200 square feet in size); wide tree lawns (>6 feet wide); medium-sized parking lot islands (100-200 square feet in size); medium-sized tree lawns (4-6 feet wide); recommended for buffer strips around parking lots or for median strip plantings in the highway; near a deck or patio; small parking lot islands (< 100 square feet in size); narrow tree lawns (3-4 feet wide); specimen; residential street tree; tree has been successfully grown in urban areas where air pollution, poor drainage, compacted soil, and/or drought are common

**Availability:** generally available in many areas within its hardiness range

**DESCRIPTION**

Height: 15 to 25 feet
Spread: 15 to 25 feet
Crown uniformity: symmetrical canopy with a regular (or smooth) outline, and individuals have more or less identical crown forms
Crown shape: oval; round
Crown density: dense
Growth rate: medium
Texture: medium

2. Edward F. Gilman, associate professor, Environmental Horticulture Department; Dennis G. Watson, associate professor, Agricultural Engineering Department, Cooperative Extension Service, Institute of Food and Agricultural Sciences, University of Florida, Gainesville FL 32611.
Figure 2. Shaded area represents potential planting range.

**Foliage**

- **Leaf arrangement:** alternate (Fig. 3)
- **Leaf type:** simple
- **Leaf margin:** crenate; serrate; serrulate
- **Leaf shape:** elliptic (oval)
- **Leaf venation:** banchidodrome; pinnate
- **Leaf type and persistence:** deciduous
- **Leaf blade length:** 2 to 4 inches; less than 2 inches
- **Leaf color:** green
- **Fall color:** yellow
- **Fall characteristic:** not showy

**Flower**

- **Flower color:** white
- **Flower characteristics:** spring flowering; very showy

**Fruit**

- **Fruit shape:** round
- **Fruit length:** < .5 inch
- **Fruit covering:** fleshy
- **Fruit color:** orange; red

**Fruit characteristics:** attracts birds; no significant litter problem; persistent on the tree; showy

**Trunk and Branches**

- **Trunk/bark/branches:** droop as the tree grows, and will require pruning for vehicular or pedestrian clearance beneath the canopy; routinely grown with, or trainable to be grown with, multiple trunks; not particularly showy; tree wants to grow with several trunks but can be trained to grow with a single trunk; no thorns
- **Pruning requirement:** needs little pruning to develop a strong structure
- **Breakage:** resistant
- **Current year twig color:** brown; reddish
- **Current year twig thickness:** medium; thin

**Culture**

- **Light requirement:** tree grows in full sun
- **Soil tolerances:** clay; loam; sand; acidic; occasionally wet; alkaline; well-drained
- **Drought tolerance:** moderate
- **Aerosol salt tolerance:** moderate
- **Soil salt tolerance:** moderate

Other

Roots: surface roots are usually not a problem
Winter interest: tree has winter interest due to unusual form, nice persistent fruits, showy winter trunk, or winter flowers
Outstanding tree: tree has outstanding ornamental features and could be planted more
Invasive potential: little, if any, potential at this time
Verticillium wilt susceptibility: not known to be susceptible
Pest resistance: long-term health usually not affected by pests

USE AND MANAGEMENT

Plants are used as specimens, patios, and along streets to create a bright glow of color each spring. Some pruning to remove and train lower branches is needed along streets and in other areas where vehicular or pedestrian clearance is needed. The pruning requirement can be minimized by specifying tree-form Crabapple from the nursery. The trees are attractive during the summer, bearing glossy green foliage and a moderately dense crown. Popular around overhead powerlines due to their small stature, a row of Crabapples along each side of the street or median strip can "make" a neighborhood. Select plants which have been grafted onto EMLA 106 or 111 rootstock to reduce root suckering.

They are best grown in a sunny location with good air circulation and have no particular soil preferences, except soil should be well drained. Crabapple is well-adapted to compacted urban soil, tolerates drought and poor drainage well and is somewhat tolerant of salt-spray. Well adapted to all areas within its hardiness zone range, including Texas and Oklahoma. It is a very adaptable tree for urban landscapes. Do not overfertilize since this could increase the incidence of disease. Root pruned trees appear to transplant most easily. Crabapples grow well in the Texas panhandle but are not extremely drought tolerant and are not well suited for high pH soil.

Other white flowered cultivars include: ‘Baccata Columnaris’ - narrow crown, white flowers, red or yellow fruit; ‘Baccata Gracilis’ - slow-growing, shrub-like, white flowers, fruit small and dark red, annual bearer; ‘Baccata Jackii’ - upright form, white flowers, bright red fruit, annual bearer, also good to excellent disease resistance; ‘Callaway’ - pink buds, white flowers, red fruit; ‘David’ - pink buds open to white flowers, scarlet fruit, good to excellent disease resistance; ‘Dolgo’ - pink buds, white flowers, large red fruits; ‘Donald Wyman’ - disease-resistant but susceptible to fire blight, glossy red showy fruit; ‘Ellwangeriana’ - red fruit, disease-resistant; ‘Floribunda’ - pink to red bud opens to single white flower, yellow or red fruit - commonly available; ‘Gloriosa’ - pink bud opens to white flower, red, large fruit; ‘Golden Hornet’ - upright arching habit, white flower, yellow fruit; ‘Gorgeous’ - pink bud opens to large, white flower, red to orange fruit; ‘Harvest Gold’ - white flowers followed by yellow fruits; ‘Hupehensis’ - Tea Crabapple - pink buds open to white flowers, greenish fruit; ‘Katherine’ - double flowers opening pink, fading to white, fruit yellow and red; ‘Mary Potter’ - pink buds open to single white flowers, red and fairly large fruit, susceptible to scab and powdery mildew; ‘Red Jade’ - weeping habit, white flowers, red fruit persisting after leaves drop; ‘Sargenti’ - dwarf, pink bud opens to white flowers, small dark red fruit; ‘Tanner’ - white flowers, red fruits, susceptible to diseases; ‘Tschonoski’ - white flowers, vigorous growth, good bronze red fall color, fruit brownish; ‘White Angel’ - white flowers, glossy red fruit persisting into winter; ‘White Candle’ - pink buds open to white flowers, red fruit, upright growth habit; ‘Zumi Calocarpa’ - white flowers, bright red persistent fruit.

One of the best Crabapples for the south is Malus x Callaway.

**Pests**

Aphids infest branch tips and suck plant juices, and are quite common. They can deform newly emerging foliage and secret honey dew creating a sticky mess beneath the tree, but will not kill the tree.

Fall webworm makes nests on the branches and feeds on foliage inside the nest. Small nests can be pruned out or sprayed with *Bacillus thuringiensis*. Controlling severe infestations may require other chemicals.

Scales of various types are controlled with horticultural oil.

Borers can be a problem on stressed trees.

Mites are too small to see easily so they can cause much foliage discoloration before being detected. Mites can be controlled to a degree with horticultural oil, but other chemicals are often required by the time mites are detected. The mite infestation can also be severe by the time foliage chlorosis or bronzing is evident.

Eastern tent caterpillar builds tents or nests in trees in early summer or late spring. Feeding occurs on foliage outside the nest. Defoliation can be extensive if infestation is severe, and repeated defoliations for several years can weaken trees. Small nests can be removed by pruning them from the tree. Spray with *Bacillus thuringiensis* or other approved chemical. Do not burn nests while they are still in the tree.

**Diseases**

Fairly susceptible to disease.

Scab infection takes place early in the season and dark olive green spots appear on the leaves. In late summer the infected leaves fall off when they turn yellow with black, spots. Infected fruits have black, slightly raised spots. Use resistant varieties to help avoid this severe problem.

Leaves on infected branch tips turn brown or black, droop, and hang on the branches. The leaves look scorched as by a fire. The trunk and main branches become infected when the bacteria are washed down the branches. Cankers form and are separated from adjacent healthy bark by a crack. The infected bark may be shredded. Use resistant cultivars when available since severe infections on susceptible trees can kill the tree.

Powdery mildew coats leaves with white fungal growth resembling powder.

Cedar apple rust causes brown to rusty-orange spots on the leaves. Badly spotted leaves fall prematurely, and defoliation can be heavy. Redcedars (*Juniperus virginiana*) are the alternate host.

Crabapples are subject to several canker diseases. Prune out infected branches, avoid unnecessary wounding, and keep trees healthy.
