Malus x ‘Spring Snow’
‘Spring Snow’ Crabapple

Edward F. Gilman and Dennis G. Watson

INTRODUCTION

‘Spring Snow’ Crabapple is unusual in that it is typically fruitless (Fig. 1). Its use should be limited in areas where scab, fireblight or rust is a problem. The dense, oval crown grows to about 25 to 30 feet tall and 15 to 20 feet wide. Early pruning to remove lower branches and purchasing tree-form specimens at the nursery can usually ensure that pruning requirement can be kept to a minimum.

GENERAL INFORMATION

Scientific name: Malus x ‘Spring Snow’
Pronunciation: MAY-lus
Common name(s): ‘Spring Snow’ Crabapple
Family: Rosaceae
USDA hardiness zones: 3 through 8A (Fig. 2)
Origin: not native to North America
Uses: Bonsai; espalier; large parking lot islands (> 200 square feet in size); wide tree lawns (>6 feet wide); medium-sized parking lot islands (100-200 square feet in size); medium-sized tree lawns (4-6 feet wide); recommended for buffer strips around parking lots or for median strip plantings in the highway; near a deck or patio; small parking lot islands (< 100 square feet in size); narrow tree lawns (3-4 feet wide); specimen; residential street tree; tree has been successfully grown in urban areas where air pollution, poor drainage, compacted soil, and/or drought are common
Availability: generally available in many areas within its hardiness range

DESCRIPTION

Height: 25 to 30 feet
Spread: 15 to 20 feet
Crown uniformity: symmetrical canopy with a regular (or smooth) outline, and individuals have more or less identical crown forms
Crown shape: oval; upright
Crown density: dense

Figure 1. Middle-aged ‘Spring Snow’ Crabapple.

1. This document is adapted from Fact Sheet ST-396, a series of the Environmental Horticulture Department, Florida Cooperative Extension Service, Institute of Food and Agricultural Sciences, University of Florida. Publication date: October 1994.

2. Edward F. Gilman, associate professor, Environmental Horticulture Department; Dennis G. Watson, associate professor, Agricultural Engineering Department, Cooperative Extension Service, Institute of Food and Agricultural Sciences, University of Florida, Gainesville FL 32611.
Growth rate: medium
Texture: medium

Foliage

Leaf arrangement: alternate (Fig. 3)
Leaf type: simple
Leaf margin: crenate; serrate; serrulate
Leaf shape: elliptic (oval)
Leaf venation: banchidodrome; pinnate
Leaf type and persistence: deciduous
Leaf blade length: 2 to 4 inches; less than 2 inches
Leaf color: green
Fall color: yellow
Fall characteristic: not showy

Flower

Flower color: white
Flower characteristics: spring flowering; very showy

Fruit

There is no fruit on this tree.

Trunk and Branches

Trunk/bark/branches: droop as the tree grows, and will require pruning for vehicular or pedestrian clearance beneath the canopy; routinely grown with, or trainable to be grown with, multiple trunks; not particularly showy; tree wants to grow with several trunks but can be trained to grow with a single trunk; no thorns
Pruning requirement: needs little pruning to develop a strong structure
Breakage: resistant
Current year twig color: brown; reddish
Current year twig thickness: medium; thin

Culture

Light requirement: tree grows in full sun
Soil tolerances: clay; loam; sand; acidic; occasionally wet; alkaline; well-drained
Drought tolerance: moderate
Aerosol salt tolerance: low
Soil salt tolerance: moderate

Other

Roots: surface roots are usually not a problem
Winter interest: no special winter interest
Outstanding tree: not particularly outstanding
Invasive potential: little, if any, potential at this time
Verticillium wilt susceptibility: not known to be susceptible
Pest resistance: very sensitive to one or more pests or diseases which can affect tree health or aesthetics

USE AND MANAGEMENT

Plants are used for specimens, patios, and along streets to create a warm glow of color each spring. They are attractive during the summer, bearing glossy green foliage. A row of Crabapples along each side of the street or median strip can "make" a neighborhood. Select plants which have been grafted onto EMLA 106 or 111 rootstock to reduce root suckering.

It is best grown in a sunny location with good air circulation and have no particular soil preferences, except soil should be well drained. Crabapple is well-adapted to compacted urban soil, tolerates drought and poor drainage well and is somewhat tolerant of salt-spray. Well adapted to all areas within its hardiness zone range, including Texas and Oklahoma. Do not overfertilize since this could increase the incidence of disease. Select only from more disease-resistant cultivars if scab, fireblight or rust is a problem in the area. Root-pruned trees appear to transplant most easily. Crabapples grow well in the Texas panhandle but are not extremely drought tolerant and are not well suited for high pH soil.

Other white flowered cultivars include: ‘Baccata Columnaris’ - narrow crown, white flowers, red or yellow fruit; ‘Baccata Gracilis’ - slow-growing, shrub-like, white flowers, fruit small and dark red, annual bearer; ‘Baccata Jackii’ - upright form, white flowers, bright red fruit, annual bearer, also good to excellent disease resistance; ‘Callaway’ - pink buds, white flowers, red fruit; ‘David’ - pink buds open to white flowers, scarlet fruit, good to excellent disease resistance; ‘Dolgo’ - pink buds, white flowers, large red fruits; ‘Donald Wyman’ - disease-resistant but susceptible to fire blight, glossy red showy fruit; ‘Ellwangeriana’ - red fruit, disease-resistant; ‘Floribunda’ - pink to red bud opens to single white flower, yellow or red fruit - commonly available; ‘Gloriosa’ - pink bud opens to white flower, red, large fruit; ‘Golden Hornet’ - upright arching habit, white flower, yellow fruit; ‘Gorgeous’ - pink bud opens to large, white flower, red to orange fruit; ‘Harvest Gold’ - white flowers followed by yellow fruits; ‘Hupehensis’ - Tea Crabapple - pink buds open to white flowers, greenish fruit; ‘Katherine’ - double flowers opening pink, fading to white, fruit yellow and red; ‘Mary Potter’ - pink buds open to single white flowers, red and fairly large fruit, susceptible to scab and powdery mildew; ‘Red Jade’ - weeping habit, white flowers, red fruit persisting after leaves drop; ‘Sargenti’ - dwarf, pink bud opens to white flowers, small dark red fruit; ‘Snowdrift’ - white flowers, orange red fruit; ‘Tanner’ - white flowers, red fruits, susceptible to diseases; ‘Tschonoski’ - white flowers, vigorous growth, good bronze red fall color, fruit brownish; ‘White Angel’ - white flowers, glossy red fruit persisting into winter; ‘White Candle’ - pink buds open to white flowers, red fruit, upright growth habit; ‘Zumi Calocarpa’ - white flowers, bright red persistent fruit.

One of the best Crabapples for the south is *Malus* x Callaway.

Pests

Aphids infest branch tips and suck plant juices, and are quite common. They can deform newly emerging foliage and secret honey dew creating a sticky mess beneath the tree, but will not kill the tree.

Fall webworm makes nests on the branches and feeds on foliage inside the nest. Small nests can be pruned out or sprayed with *Bacillus thuringiensis*. Controlling severe infestations may require other chemicals.

Scales of various types are controlled with horticultural oil.

Borers can be a problem on stressed trees.

Mites are too small to see easily so they can cause much foliage discoloration before being detected. Mites can be controlled to a degree with horticultural oil, but other chemicals are often required by the time mites are detected. The mite infestation can also be severe by the time foliage chlorosis or bronzing is evident.

Eastern tent caterpillar builds tents or nests in trees in early summer or late spring. Feeding occurs on foliage outside the nest. Defoliation can be extensive if infestation is severe, and repeated defoliations for several years can weaken trees. Small nests can be removed by pruning them from the tree. Spray with *Bacillus thuringiensis* or other approved chemical. Do not burn nests while they are still in the tree.

Diseases

Fairly susceptible to disease.

Scab infection takes place early in the season and dark olive green spots appear on the leaves. In late summer the infected leaves fall off when they turn yellow with black, spots. Infected fruits have black, slightly raised spots. Use resistant varieties to help avoid this severe problem.

Fire blight susceptible trees have blighted branch tips, particularly when the tree is growing rapidly. Leaves on infected branch tips turn brown or black, droop, and hang on the branches. The leaves look scorched as by a fire. The trunk and main branches become infected when the bacteria are washed down the branches. Cankers form and are separated from adjacent healthy bark by a crack. The infected bark may be shredded. Use resistant cultivars when available since severe infections on susceptible trees can kill the tree.

Powdery mildew coats leaves with white fungal growth resembling powder.

Cedar apple rust causes brown to rusty-orange spots on the leaves. Badly spotted leaves fall prematurely, and defoliation can be heavy. Redcedars (*Juniperus virginiana*) are the alternate host.

Crabapples are subject to several canker diseases. Prune out infected branches, avoid unnecessary wounding, and keep trees healthy.
