Robinia pseudoacacia
Black Locust

Edward F. Gilman and Dennis G. Watson

INTRODUCTION

A fast-growing native deciduous tree, Black Locust is capable of reaching 70 to 80 feet in height but is more often seen 30 to 50 feet tall with a spread of 20 to 35 feet (Fig. 1). The upright growth and short, irregular branches form an open canopy and cast light shade below the tree, allowing a lawn to thrive. The 6 to 14-inch-long, dull, blue/green leaves, made up of multiple leaflets, are some of the last to appear in spring and often drop early in the autumn, just barely fading to a sickly yellow/green before dropping. For approximately a 10-day period in late spring, the trees are festooned with four to eight-inch-long, dense clusters of extremely fragrant, one-inch white blossoms (similar to sweet-peas) which are literally "alive" with the bustling activity of visiting bees. The honey which is produced is quite delicious and sought-after. The two to four-inch-long, dark red to black, leathery seeds pods which follow will persist on the trees throughout the winter.

GENERAL INFORMATION

Scientific name: Robinia pseudoacacia
Pronunciation: roe-BIN-nee-uh
soo-doe-uh-KAY-shuh
Common name(s): Black Locust, Common Locust
Family: Leguminosae
USDA hardness zones: 4 through 8 (Fig. 2)
Origin: native to North America
Uses: reclamation plant; shade tree; no proven urban tolerance
Availability: somewhat available, may have to go out of the region to find the tree

DESCRIPTION

Height: 40 to 70 feet
Spread: 25 to 35 feet
Crown uniformity: irregular outline or silhouette
Crown shape: oval; upright
Crown density: open
Growth rate: fast
Texture: fine

1. This document is adapted from Fact Sheet ST-570, a series of the Environmental Horticulture Department, Florida Cooperative Extension Service, Institute of Food and Agricultural Sciences, University of Florida. Publication date: October 1994.

2. Edward F. Gilman, associate professor, Environmental Horticulture Department; Dennis G. Watson, associate professor, Agricultural Engineering Department, Cooperative Extension Service, Institute of Food and Agricultural Sciences, University of Florida, Gainesville FL 32611.
Foliage

Leaf arrangement: alternate (Fig. 3)
Leaf type: odd pinnately compound
Leaflet margin: entire
Leaflet shape: elliptic (oval); oblong; obovate
Leaflet venation: pinnate
Leaf type and persistence: deciduous
Leaflet blade length: less than 2 inches
Leaf color: blue or blue-green; green
Fall color: yellow
Fall characteristic: not showy

Flower

Flower color: white
Flower characteristics: pleasant fragrance; spring flowering; very showy

Fruit

Fruit shape: pod
Fruit length: 3 to 6 inches; 1 to 3 inches
Fruit covering: dry or hard
Fruit color: black; red

Fruit characteristics: attracts birds; attracts squirrels and other mammals; inconspicuous and not showy; fruit, twigs, or foliage cause significant litter; persistent on the tree

Trunk and Branches

Trunk/bark/branches: grow mostly upright and will not droop; showy trunk; should be grown with a single leader; thorns are present on the trunk or branches

Pruning requirement: requires pruning to develop strong structure

Breakage: susceptible to breakage either at the crotch due to poor collar formation, or the wood itself is weak and tends to break

Current year twig color: brown
Current year twig thickness: thin
Wood specific gravity: 0.69

Culture

Light requirement: tree grows in part shade/part sun; tree grows in full sun
Soil tolerances: clay; loam; sand; acidic; alkaline; well-drained
Drought tolerance: high
Soil salt tolerance: good

Other

Roots: surface roots can lift sidewalks or interfere with mowing  
Winter interest: tree has winter interest due to unusual form, nice persistent fruits, showy winter trunk, or winter flowers  
Outstanding tree: not particularly outstanding  
Invasive potential: seeds itself into the landscape  
Ozone sensitivity: tolerant  
Verticillium wilt susceptibility: susceptible  
Pest resistance: very sensitive to one or more pests or diseases which can affect tree health or aesthetics

USE AND MANAGEMENT

These seeds are widely dispersed by birds and other wildlife, and along with the root suckering and invasive root system, Black Locust can spread into surrounding landscapes. This feature, along with the thorns found along the branches, should be considered when placing Black Locust in the ornamental garden. It is probably best saved for the reclamation project or roadside planting where trees receive no maintenance. If left to its own devices, it will form dense thickets, even on the poorest soils, a fact which makes it quite useful in reclamation applications.

Although the wood of Black Locust is reputed to be extremely strong and durable (pioneers used it to fashion nails for building ships and houses), the branches are brittle and subject to damage in high winds. This may be due largely to the tendency for the branches to form a narrow angle with the trunk and to grow aggressively relative to the trunk forming embedded bark. This can be partially corrected by pruning the major branches so they grow to no more than about half the size of the trunk.

Able to tolerate drought, salt, and poor soil, Black Locust will grow in full sun or partial shade on almost any soil acid or alkaline except that which is permanently wet. A tough tree which should be saved for the toughest sites. Not for general use in urban areas due to borer problems unless located in a moist, well-drained site with plenty of soil space.

Cultivars include: ‘Erecta’, upright form; ‘Frisia’ - yellowish leaves in early summer; and ‘Purple Robe’, lavender flowers. ‘Purple Robe’ is gorgeous in full bloom.
Propagation is by seed or cuttings.

**Pests**

Locust borer is a serious pest although borer-resistant clones are now being developed. It is also bothered by carpenterworm, locust leaf miner, and scales. Leaf miner is a universal problem, and the trees along the highways in the south can be seen in summer riddled with damage from this pest.

**Diseases**

Black Locust is susceptible to canker, leaf spot, and powdery mildew.
